Evaluation of climate and air quality models based on observations

aerosol extreme events, aerosol trends, ...

A. Mortier, MET Norway

Outline

- introduction (models, products, challenges, ...)
- some results
 - aerosol extreme events
 - aerosol trends
- an interactive evaluation interface: pyaerocom / AeroVal

Augustin Mortier, PhD

MET Norway, Climate and Air Quality department

augustinm@met.no

Experience & Activities

 Iidars/surp.
 aerosol trends, mouc.
 data visualization & web
 welopment lidars/sunphotometers (PhD thesis) aerosol trends, model evaluation

- policy support -(policy.atmosphere.copernicus.eu)
- model evaluation (aeroval.met.no)
- aerosol alerts (aerosolalerts.atmosphere.copernicus.eu)

Motivations for model evaluation

- How does my model perform? (strengths, weaknesses)
- How can I improve my model?

- \rightarrow Are there biases in my model's predictions?
- → How well does my model capture the variability? time/space patterns or trends
- \rightarrow How sensitive is my model to parameters?
 - Which parameter?
 - Where?
 - When?

Nobody likes a wrong model prediction

Models

"Air quality models use mathematical and numerical techniques to simulate the physical and chemical processes that affect **air pollutants** as they disperse and react in the atmosphere."

 \rightarrow CHIMERE, EMEP*, LOTOS-EUROS, MOCAGE, ..., + ENSEMBLE

regional, high resolution, good representation of emissions, transport and chemical reactions

"Climate models use quantitative methods to simulate the interactions of the important drivers of climate, including atmosphere, oceans, land surface and ice. They are used for a variety of purposes from study of the dynamics of the climate system to projections of future climate."

 \rightarrow Earth System Models: NorESM*, CanESM, CESM, GFDL, EC-Earth (IFS)...

global models, simplified chemistry, but several components

NorESM2 Vs EMEP MSC-W

Standard atm. model products: aerosol, gases, meteorological parameters

- 3D: time, lat, lon
- 4D: time, lat, lon,

elevation

- Air quality models
 - Concentrations
 - PM₁₀, PM_{2.5}
 - Chemical species: O₃, SO₂, SO₄, NO, BC, ...
 - Meteorological parameters: T, RH, P, precip., u/v, ...
- Climate models
 - Radiative fluxes
 - Optical and microphysical properties: AOD, scat/abs, ext(z), Size Distribution
 - Meteorological parameters: T, RH, P, precip., u/v, ...

Cesa Cesa CECMWF

Model evaluation

- \rightarrow comparisons
 - model VS ground-based obs.
 - model VS satellite

but methods also relevant for

- satellite VS ground-based obs → "validation"
- model v1 VS model v2 \rightarrow sensitivity tests

Observations

Challenges

- By nature
 - **observations** are **not perfect**: continuity, uncertainty, noise, outliers
 - models are not perfect: simplification of processes, uncertainty, outliers (and bugs)
 - representativeness (time, space):
 - deserts, oceans, forests / urban vs rural: local emissions
 - sunphotometer: wintertime?
 - **homogeneity** of measurements: observation networks (calibration, protocols)
 - wet VS dry: some in-situ instruments measure dried particles
- Technical
 - data access: ACTRIS RI, EBAS, ...
 - data reading
 - model: NetCDF
 - observations: anything (NetCDF, csv, excel, ...)
 - make sure things are **comparable**: units, point of view (attenuated backscatter profile)
 - o colocation: nearest neighbor, inter/extrapolation, time resampling
 - \circ concentration / deposition \rightarrow average / accumulate
 - o vertical coordinates: altitude VS layers / pressure

Table 2: Information on models used in this study (CAMS-Rean: CAMS reanalysis, AP3: AeroCom phase III, CMIP6: historical experiments from CMIP6).

Region definition & Observation coverage

Figure 2: Distribution of the observations within the different regions considered in this study. The numbers reported within each region correspond to the maximum number of stations given for the observation networks, corresponding to the five observation types found in the legend.

Cesa CECMWF

Regional Time Series

Figure 3: Regional time series of AOD. The dark blue line corresponds to the median, and the light blue envelope is bound by the first and third quartiles of all valid points at the corresponding month, respectively. The blue dots correspond to the yearly averages which are used to compute the linear trend. The latter is displayed as a continuous line when the trend is significant and as a dashed line when it is not. Trend values, an error estimate and a significance value are given in each panel.

Cesa CECMWF

Trends calculations

Figure 5: Regional trends in the aerosol properties computed with the observation datasets. The color of the circles corresponds to the slope, while the radius indicates the p value. The largest circles represent the trends that are significant with a confidence level of 95%. The circles outlined in black indicate the trends associated with a representativity greater than 50%.

Cesa CECMWF

Figure 6: Regional trends in the aerosol properties computed with observations and models co-located in space and time with the observations. The error bars correspond to the uncertainty in the trend as calculated using both the uncertainty in the Theil–Sen slope and the residuals. The bold font indicates that the trends are significant at a confidence level of 95% (p value < 0.05).

Representativeness of observed trends \rightarrow model subset selection

Figure 4: Three regional AOD time series and respective trends, constructed from model data (NorESM2) for the investigation of the representativity of the observational data. Panels (a) and (b) correspond to the number of points used to compute the regional time series for the three different datasets. Panels (c) and (d) show the time series, the trends and the resulting representativity value (black, bold). The blue color (Reftime) corresponds to the model output co-located in space and time with the available observations. Panels (a) and (b) show an overall increase in the number of available observations (more stations) combined with a seasonal cycle (less AOD available in wintertime). The orange color (Exptime/Refspace) corresponds to the model output co-located in space with the stations providing measurements, using the complete time series from 2000 to 2014. The green color (Expspace) corresponds to the model output in the whole geographic region (see Fig. 2), using all of the grid boxes without any co-location with the observations Cesa CECMWF

Modelled trends

Figure 7: Global trends in aerosol properties using NorESM2 data regridded at a 5° × 5° resolution. The blue and red dots indicate significant negative and positive trends, respectively.

Cesa CECMWF

Modelled trends

Figure 8: Absolute trends in OD and emissions of the main aerosol species computed with NorESM2. The y axis of the trends in OD and the emissions is given according to the power of 10 indicated at the top left corner of each of the subplots.

Motivations

~2 years ago - Gliß et al., 2021: <u>AeroCom</u> phase III multimodel evaluation of the aerosol life cycle and optical propertie using ground- and space-based remote sensing as well as surface in situ observations

(https://acp.copernicus.org/articles/21/87/2021)

- models: 13 + ENSEMBLE (Mean/Median)
- observations:
 - remote sensing: AERONET, satellites (MODIS, AATSR, Merged-FMI dataset)
 - in situ: EBAS (Scat./Abs. Coef.)

How to interpret all of this?

 \rightarrow exploratory/evaluation tool

AeroVal overall evaluation heatmap, adapted from Gliß et al., 2021

pyaerocom / AeroVal

About

"

pyaerocom: python library (\geq 3.6) for **processing** and **plotting** of data [related to the **AeroCom** project].

This includes support for reading and processing of **model data** (e.g. AeroCom, EMEP, ...), **satellite data** (e.g. MODIS, AATSR, ...) and **ground based observation** datasets (e.g. AERONET, EBAS, EARLINET, Ghost, AirNow, MarcoPolo, EEA, ...).

In addition, pyaerocom provides tools for **colocation** and **cross evaluation** of different datasets using **commonly used statistical metrics** such as several biases, gross-errors, or correlation

coefficients.

https://github.com/metno/pyaerocom

import pyaerocom as pya

obs_reader = pya.io.ReadUngridded('AeronetSunV3Lev2.daily')
od550aer = obs_reader.read(vars_to_retrieve='od550aer')
plot station coordinates

od550aer.plot_station_coordinates();

Cesa 🦉 CECMWF

pyaerocom / AeroVal

Conclusion

Conclusion

Some take home messages

- Important to evaluate model (in the present/past) to determine forecasts reliability
- Model evaluation highlights strengths and weaknesses of models → model improvement
- Challenges
 - Measurements representativeness
 - **Colocation** (time resampling, space)
- Scores: R, NMB, RMSE, ...
- Charts: visualization of data / scores

Look at you data from different angles
